

International Symposium on Grids and Clouds 2016

13-18 March 2016, Academia Sinica, Taipei, Taiwan

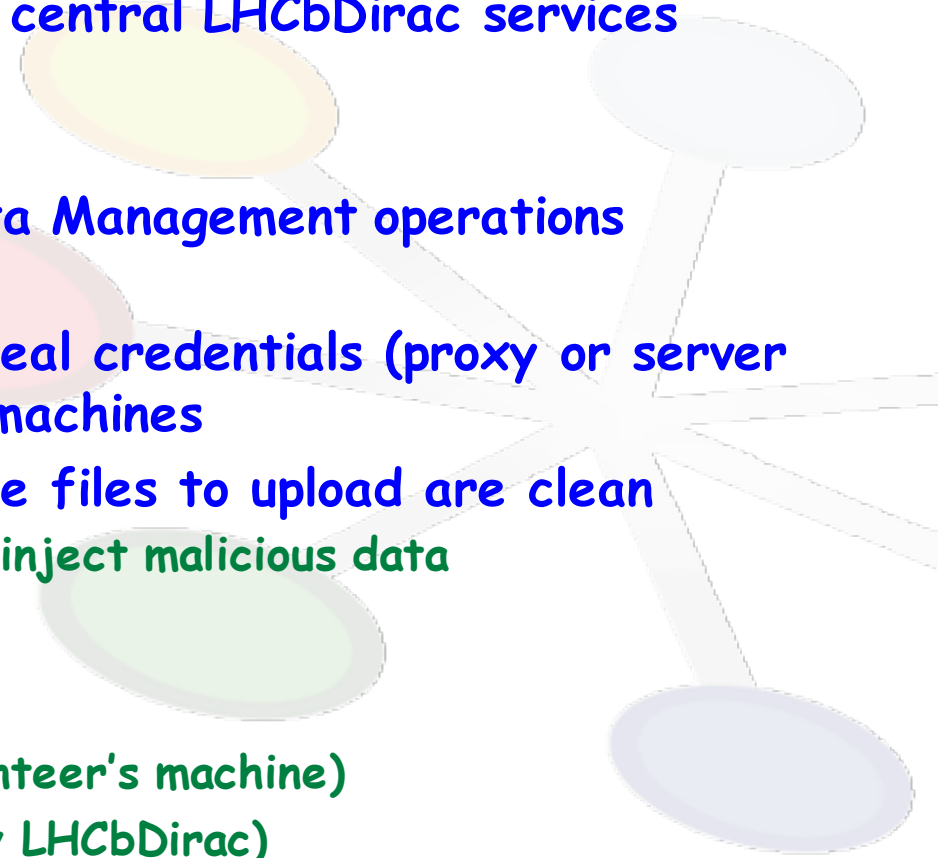

Secure gateway for Beauty@LHC

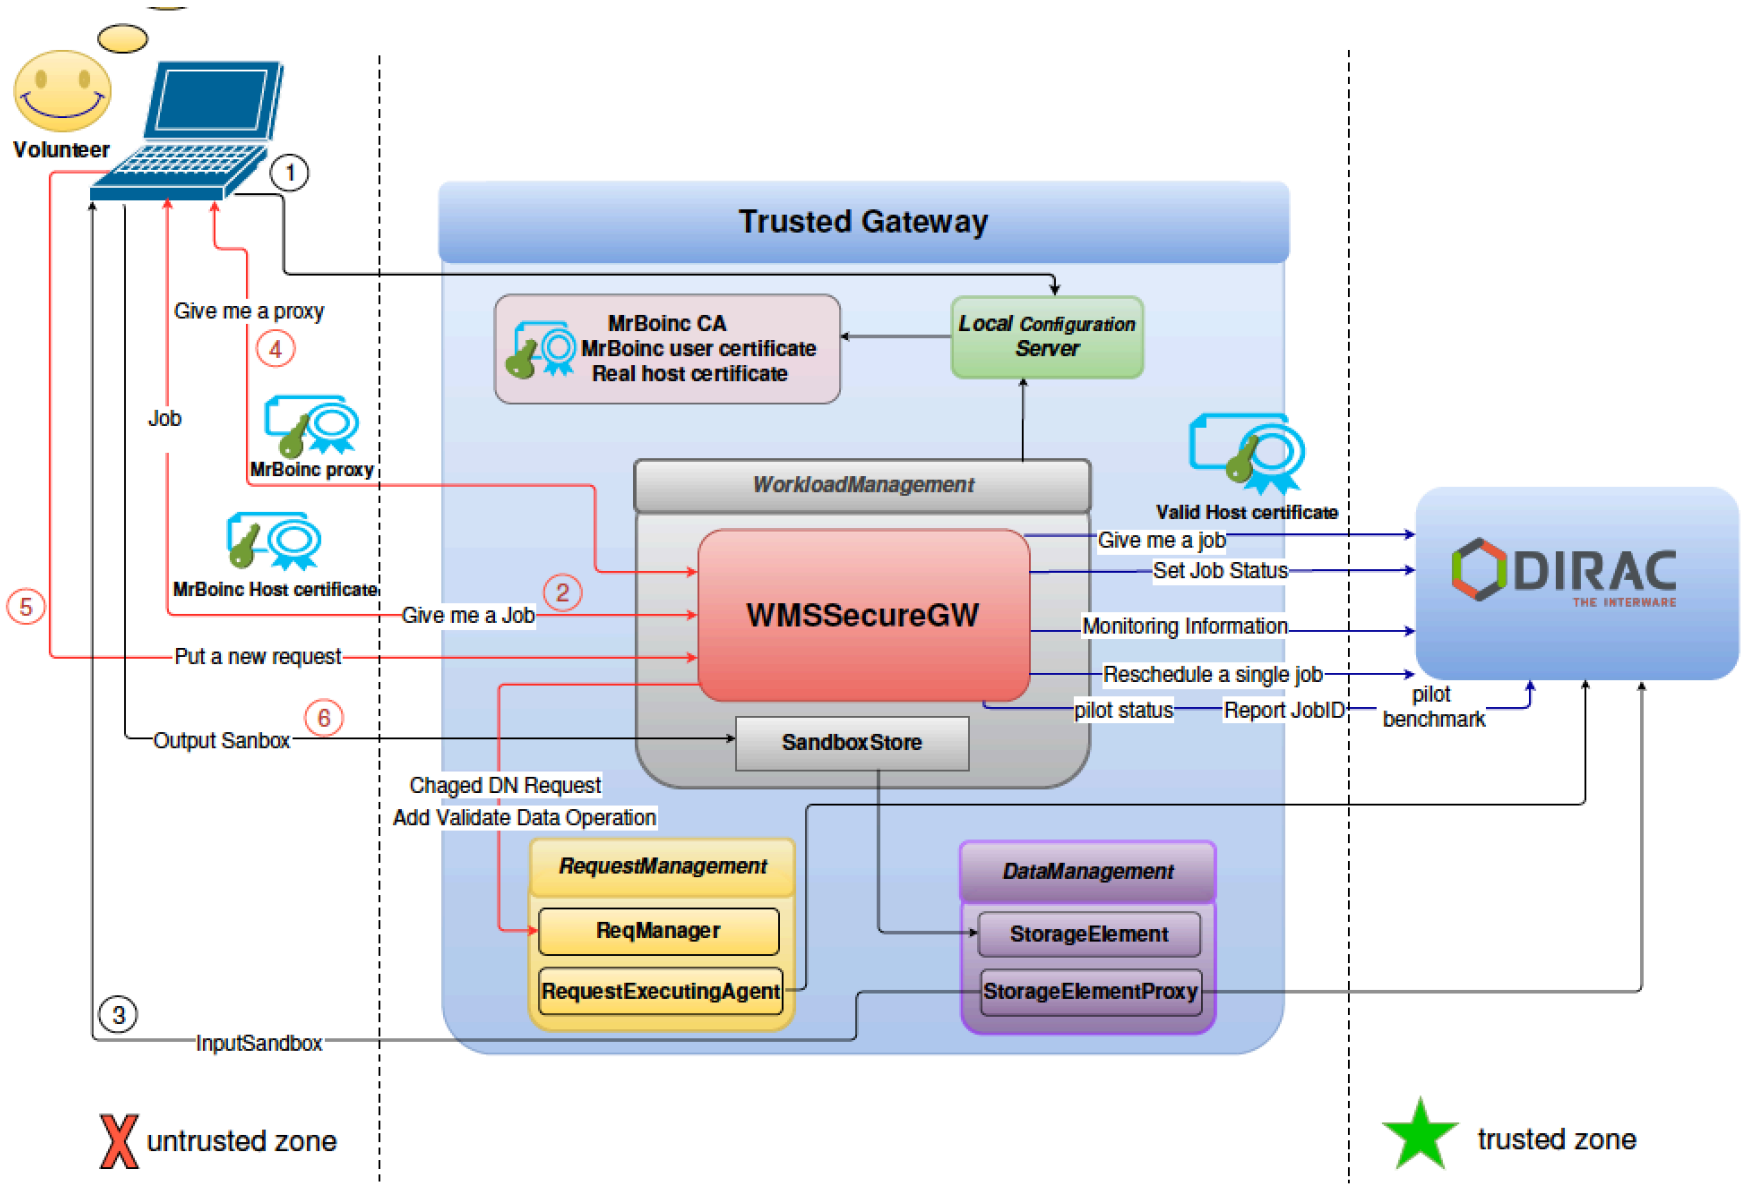

- BOINC project for volunteer computing running LHCb simulation jobs
- The problem:
 - Pilot jobs need to contact central LHCbDirac services
 - ☆ Job matching
 - ☆ Job status update
 - Jobs need to perform Data Management operations
 - ☆ Output file upload
 - We don't want to deploy real credentials (proxy or server certificate) on untrusted machines
 - We need to check that the files to upload are clean
 - ☆ The machine owner might inject malicious data
- The solution
 - Split the world in two:
 - ☆ Untrusted world (the volunteer's machine)
 - ☆ Trusted world (handled by LHCbDirac)
 - Introduce a gateway between the two worlds

The two worlds and the gateway

BEAUTY@LHC GW

- In the untrusted world:
 - Use fake credentials, using a fake CA (MrBoinc CA)
 - Credentials are associated to the BOINC Id of the user
 - ☆ Their only role is to communicate between the VM and the gateway
- In the trusted world:
 - The GW uses server certificate to obtain jobs
 - The GW uses the real credentials of the payload owner for DM operations
 - ☆ Obtained from the LHCbDirac proxy repository
- The gateway (running on a CERN VOBBox)
 - Ensures the transition between the two worlds
 - Queues Data Management request
 - ☆ Using the standard DIRAC Request Management System
 - ☆ Adding a special operation:
 - * Validate output files (log files + output data)
 - * Output data must be ROOT files
 - * Logfiles must contain specific informations

- Beauty@LHC is now ready for secure running
- The secure gateway is operational and jobs are being run using internal volunteers
- Next step: open to the general public
 - Before summer 2016
