

# JUNO Distributed Computing Infrastructure status

*Thursday, March 28, 2024 12:00 PM (20 minutes)*

The Jiangmen Underground Neutrino Observatory (JUNO) is an underground 20 kton liquid scintillator detector being built in the south of China and expected to start data taking in late 2024. The JUNO physics program is focused on exploring neutrino properties, by means of electron anti-neutrinos emitted from two nuclear power complexes at a baseline of about 53km. Targeting an unprecedented relative energy resolution of 3% at 1 MeV, JUNO will be able to study neutrino oscillation phenomena and determine neutrino mass ordering with a statistical significance of about 3 sigma within six years.

These physics challenges are addressed by a large Collaboration localized in three continents. In this context, key to the success of JUNO will be the realization of a distributed computing infrastructure (DCI), which will satisfy its predicted computing needs.

The development of the computing infrastructure is performed jointly by the Institute of High Energy Physics (IHEP), and a number of Italian, French and Russian data centers, already part of WLCG.

Upon its start, JUNO is expected to deliver 2 PB of data per year, which is to be stored in the above mentioned data centers in China and Europe. Data analysis activities will be also carried out in cooperation, according to a coordinated joint effort.

This contribution reports on the design and deployment of the JUNO DCI. It will describe its main characteristics and requirements.
