Data matures like wine, applications like fish.

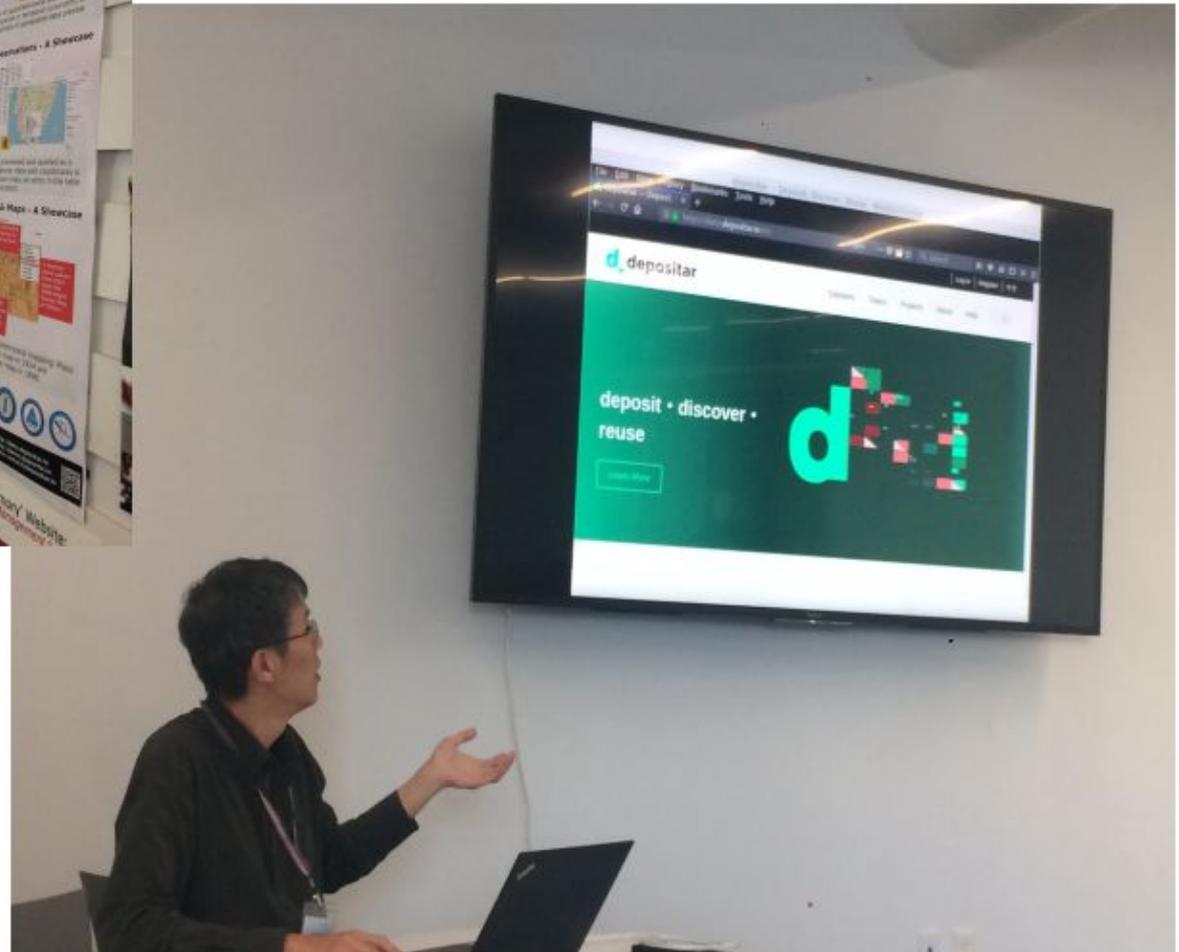

or

The depositar was formally launched at the 2018 Pacific Neighborhood Consortium Annual Conference and Joint Meetings, held in San Francisco, CA, USA.

depositar— An Open Repository for All

- Built on top of CKAN with customized extensions
 - Code contributed upstream to CKAN development
- Free software, free registration, free content
 - FAIR: “Findable, Accessible, Interoperable, Reusable”
- More a depository than a publisher
 - publisher: engage in “acquisition, copy editing, production, (e-)printing, marketing and distribution”
 - depository: “a place where something is deposited, as for storage, safekeeping or preservation”

Why build an open data portal with CKAN?

- CKAN from [OKFN](#): open source and in Python
 - repurposed and customized for research datasets
 - enriched metadata & connected to more resources
- Added features
 - Wikidata (2017)
 - Citation Widget (2018)
 - RDF Serialization (2020)
 - Archival Resource Key (2022 Q2)
 - BinderHub Integration (2023 Q4)

Take part in the CKAN ecosystem discovery work for the POSE Program!

The University of Pittsburgh and datHere are collaborating to strengthen the CKAN ecosystem with support from the U.S. National Science Foundation's POSE program. The team is conducting interviews with different members of the ecosystem and has created a list of questions to answer. Check out how you can get involved in the ecosystem discovery work.

The screenshot shows the NSF website for the Pathways to Enable Open-Source Ecosystems (POSE) program. The header includes the NSF logo, a search bar, and navigation links for Funding & Awards, News & Events, Science Topics, and About NSF. The main content area features a large banner with the title "Pathways to Enable Open-Source Ecosystems (POSE)" and a "View guidelines 23-556" button. Below the banner, there is a section for "Important Information for Proposers" and a "Synopsis" section. The synopsis describes the program's goal to harness open-source development for national and societal importance. On the right side, there is a table of "Upcoming due dates" for the "Full proposal" in 2023, with a deadline of September 7, 2023.

A Tour of depositar

The screenshot shows the Depositar web interface for a dataset titled "Coral Reef Soundscapes off Sesoko Island, Okinawa, Japan". The interface is organized into several sections:

- Recording Locations:** Describes the location of the recording sites on Sesoko Island, Okinawa, Japan, including coordinates and depth information.
- Acoustic Recorders:** Details the recording equipment used, including the model and specifications.
- Configuration of Audio Recording:** Lists the recording parameters, such as sampling rate, bit depth, and file format.
- Field Deployment:** Provides information about the deployment site and the duration of the recording period.
- Data Processing:** Describes the data processing pipeline, including the use of software like MATLAB and the resulting file formats.
- Associated Publication:** Lists the scientific publications related to the dataset.
- Metadata Table:** A table at the bottom of the page providing key metadata for the dataset, including the title, date, and contact information.

Coral Reef Soundscapes off Sesoko Island, Okinawa, Japan

This dataset is an archive of audio data of shallow-water and upper-mesophotic coral reefs off Sesoko Island, Okinawa, Japan. Python codes to visualize the audio data are also provided in a notebook based on Google Colab.

Recording Locations

Three long-term recording sites were established since May 2017. Site A (N26.635° E127.865°) is located on the southeast coast of Sesoko Island and in front of the Sesoko Station of the University of the Ryukyus. The water depth is 1.5 m. Site B (N26.665° E127.869°) is located at the bottom of a reef slope on the north of Sesoko Island and the west of Toguchi Port. The water depth is 20 m. Site C (N26.670° E127.866°) is located on a nearly flat plateau to the north of Sesoko Island and the west of Toguchi Port. The water depth is 40 m.

Acoustic Recorders

AUSOMS-mini stereo recorders (AquaSound, Kobe, Japan) were used to collect underwater sounds. From May 2017 to July 2018, six AUSOMS-mini recorders were used: 14-0106, 14-0107, 15-0106, 15-0107, 15-0109, 15-0110.

Configuration of Audio Recording

(1) Duty Cycle: continuous. (2) Sampling Rate: 44.1kHz. (3) Channels: 2. (4) File Format: MP3 (128 kbps). (5) Audio Gain: High. (6) High Pass Filter: Off.

Dataset extent

Data Processing

Audio recordings generated by AUSOMS-mini recorders were saved in MP3 format. Each MP3 is about 8-hour long and do not have a time stamp on the file name. To facilitate data management, we segmented the 8-hour long MP3 into WAV files of 5-min duration.

We used the [LTSA_gui](#) to generate long-term spectrograms (LTS) and save the LTS in mat files. Each mat file contains median-based LTS and mean-based LTS. Median-based LTS was obtained by measuring median power spectral densities within each 5-min segment. Mean-based LTS was obtained by measuring mean power spectral densities within each 5-min segment.

ABSTRACT

Information on biodiversity is essential to evaluate the ecological status of coral reefs. Sounds produced by reef-associated organisms have been used as a biodiversity indicator. However, the interference from abiotic sounds and the lack of a comprehensive audio library have impeded effective evaluation. This study investigated the application of underwater soundscapes as a remote-sensing method to detect biological and anthropogenic activities. Using techniques including the visualization of long-duration recordings, source separation, and clustering, soundscapes were separated into sounds of anthropogenic and biological sources. Our results revealed the dynamics of biological sounds among coral reefs off Sesoko Island, Okinawa, Japan. Biological sounds were much more prominent in shallow-water reefs than in upper-mesophotic reefs, but their spectral features and compositions differed. The shallow-water reefs were dominated by broadband sounds of crustaceans and low-frequency transient fish calls, whereas the upper-mesophotic reefs were characterized by a diverse array of fish choruses and transient sounds. We also discovered that shipping noise heavily interfered with the soundscapes from the upper-mesophotic reefs and represented an invisible threat to life in the low-light habitat. The applied techniques of soundscape information retrieval revealed the distinct ecological status of coral reefs and the behavior change of sound-producing organisms in high temporal resolution. Implementation of soundscape monitoring can generate ecological information on habitat quality, reef biodiversity, human activities, and their interactions. Global collaboration on underwater soundscapes will establish a data-informed platform and help stakeholders assess the resilience of coral reefs to environmental and anthropogenic stressors.

1. Introduction

Marine ecosystems provide irreplaceable services and currently face significant pressures due to climate change, human disturbance, and excessive use of marine resources. The United Nations has recognized these threats and placed the conservation of marine ecosystems as one of its sustainable development goals (UN General Assembly, 2015). Coral reefs support various social and economic activities, such as fisheries, coastal protection, and tourism, of many maritime tropical and subtropical nations (Moberg and Folke, 1999; Barbier, 2017; Spalding et al., 2017; Woodhead et al., 2019). These benefits rely on the abundant biodiversity in coral reefs. However, coral reefs have undergone recurrent high-frequency bleaching episodes over the past 20 years due to increased sea surface temperatures (Hughes et al., 2017, 2018). Therefore, detailed information on the spatiotemporal changing patterns of marine biodiversity and interactions with human activities is crucial for

the conservation management of coral reefs.

Biodiversity monitoring in coral reefs remains challenging, partially due to the distinct reef environments and their unique fish assemblages (Pearman et al., 2018; Dumalagan et al., 2019). A comprehensive and long-term assessment of reef biodiversity, environmental characteristics, and human activities may not be feasible because of limited resources for observation and survey opportunities, especially for developing regions or remote reefs. An underwater sensing system capable of monitoring the changing patterns of marine biodiversity, with the ability to diagnose potential risks due to environmental and anthropogenic stressors, is required for establishing management strategies of coral reefs and for providing alerts to the early-warning signs of ecosystem changes (Schmeller et al., 2017; Obura et al., 2019).

A potential solution for such an underwater sensing platform is through monitoring ocean sounds. One autonomous recorder can store long-duration audio recordings, with improved time resolution of

The image shows a data visualization interface with a map view. The top navigation bar includes "All resources" and "View resource". Below it, there are options for "Edit resource", "DataStore", "Data Dictionary", and "Views". A "New view" dropdown menu is open, showing options like "Audio", "Data Explorer", "Grid", "Image", "Map", "Video", and "Website". The "Map" option is highlighted with a red arrow pointing to a search dropdown menu. In the search dropdown, "Rana longicrus" is selected. The main map area shows a map of Taiwan with several blue location pins. A red box highlights the "Rana longicrus" filter in the top right of the map area. Below the map, there is an "Add Filter" button and a "Row offset:" label.

System Limitation

The image shows a sidebar from the CKAN Depositar user guide. At the top is the 'd_depositor' logo with 'stable' underneath. Below that is a search bar labeled 'Search docs'. The sidebar is titled 'User guide' and contains a list of navigation items: 'What is CKAN?', 'Using depositar', 'Registering and logging in', 'Features for publishers', 'Finding data', 'DataStore API', 'RDF Serializations', and 'ARK Persistent Identifier'.

Make the changes you require and then select the “Update Profile” button.

Note

If you change your username, CKAN will log you out. You will need to log back in using your new username.

System Limitation

- File size limit: up to around 1 GB.
- File size limit for data preview: up to around 20 MB for general format. Up to dozens of MB for PDFs.
- Filename length: 3 to 100 characters (including the filename extension).
- Limitations of XLS/XLSX/CSV files: the field name length must be less than or equal to 63 characters (or 21 Chinese characters). Merged cells and multiple sheets are not supported.

Filter by location and time

The screenshot shows the Depositar website interface. At the top left is the logo for 'depositor 研究資料寄存所'. Below it is a navigation bar with a home icon and the text 'Datasets ?'. A search bar contains the text 'Search datasets...'. Below the search bar, it says '226 datasets found'. A 'Filter by location' section is highlighted with a red border. It features a map of Taiwan with a red bounding box around the central region. Below the map, there are two filter buttons: 'Filter by time' with a calendar icon and a value of '1752', and another filter button with a value of '2100'. The map is credited to 'OpenStreetMap contributors'.

This screenshot shows a dataset page on the Depositar website. At the top, there is a search bar with the text 'Search datasets...'. Below it, it says '226 datasets found' and 'Order by:'. A 'Filter by location' section is visible, featuring a map of Taiwan with a red bounding box around the central region. Below the map, there are two filter buttons: 'Filter by time' with a calendar icon and a value of '1752', and another filter button with a value of '2100'. The map is credited to 'OpenStreetMap contributors'. Below the map, there is a 'Wikidata Keywords' section with a list of keywords: 'Taiwan' (20), 'Web Map Tile Service' (14), 'climate change' (12), and 'Taiwan' (12). To the right of the map, there is a 'Cancel' button. Below the map, there is a 'Add Dataset' button. The dataset title is 'School_WBGT_in_Taiwan_From_2016_to_2022_during_hot_se:' and it has no description. The dataset is in CSV format. The title is '核電廠選址相關地圖' and the description is '本資料集主要用於放置國立政治大學創新民主中心核能廠房選址工作坊之地圖與相關網頁'. The dataset is in HTML format and has a quality score of 'qq2'.

Deep-sea soundscapes of Japan

This dataset is an archive of acoustic data associated with the deep-sea soundscapes of Japan. Python codes to visualize the audio data are also provided in a notebook based on Google Colab.

Recording Locations

Four deep-sea ecosystems around Japan were recorded. This includes the benthic habitats off Sanriku, the twilight zone of Suruga Bay, the hydrothermal vents of Suiyo Seamount, and the abyssal plains off Minamitorishima Island.

- Off Sanriku: multiple recording locations were surveyed between July 21 and August 5, 2019 within an area enclosed by 39°02.3486' N, 39°24.1055' N, 142°08.2092' E, and 142°27.0315' E. The depth range was between 250-1011 m.

「松山飛松山」首航 華航創先例

台灣松山機場往日本松山機場的同名航線今首航！（圖擷取自年代新聞台）

2013/10/11 11:33

【即時新聞／綜合報導】台灣松山機場往日本松山機場的同名航線今首航！此舉也是台灣松山機場後，破例開放二線城市日本愛媛松山機場航線，首航班機採包機制，共有158個經濟艙位民眾紛紛表示，全球首例當然要捧場，不過最重要的還是只需2小時就到日本。

中華航空公司創下全球首例，加開台灣松山機場對飛日本松山機場的對飛航線，而今天的首航多將有158位幸運乘客創下歷史先例，搶到首航機票的民眾直呼，既然是首航當然要捧場，且了，只要兩小時。

另外，台灣松山機場也破格開放二線城市機場對飛，對此，搭機乘客則認為，雖然愛媛比較偏本都逛大城市，藉機來趟祕境之旅也會有不一樣的感受。

Demo

<https://pid.depositar.io/ark:37281/k5d951q1h>

The screenshot shows a JupyterLab environment. On the left, a file browser displays two files: 'Example.ipynb' and 'TurtleSpot2022_v2_gbifV1.7.csv', both last modified 18 hours ago. An orange box highlights the file list, and a callout box points to it with the text: '② A JupyterLab with resources in the dataset will be presented'.

The main area shows a code editor with the following Python code:

```
[3]: # Group by county
county_df = df.groupby(["county"]).count()

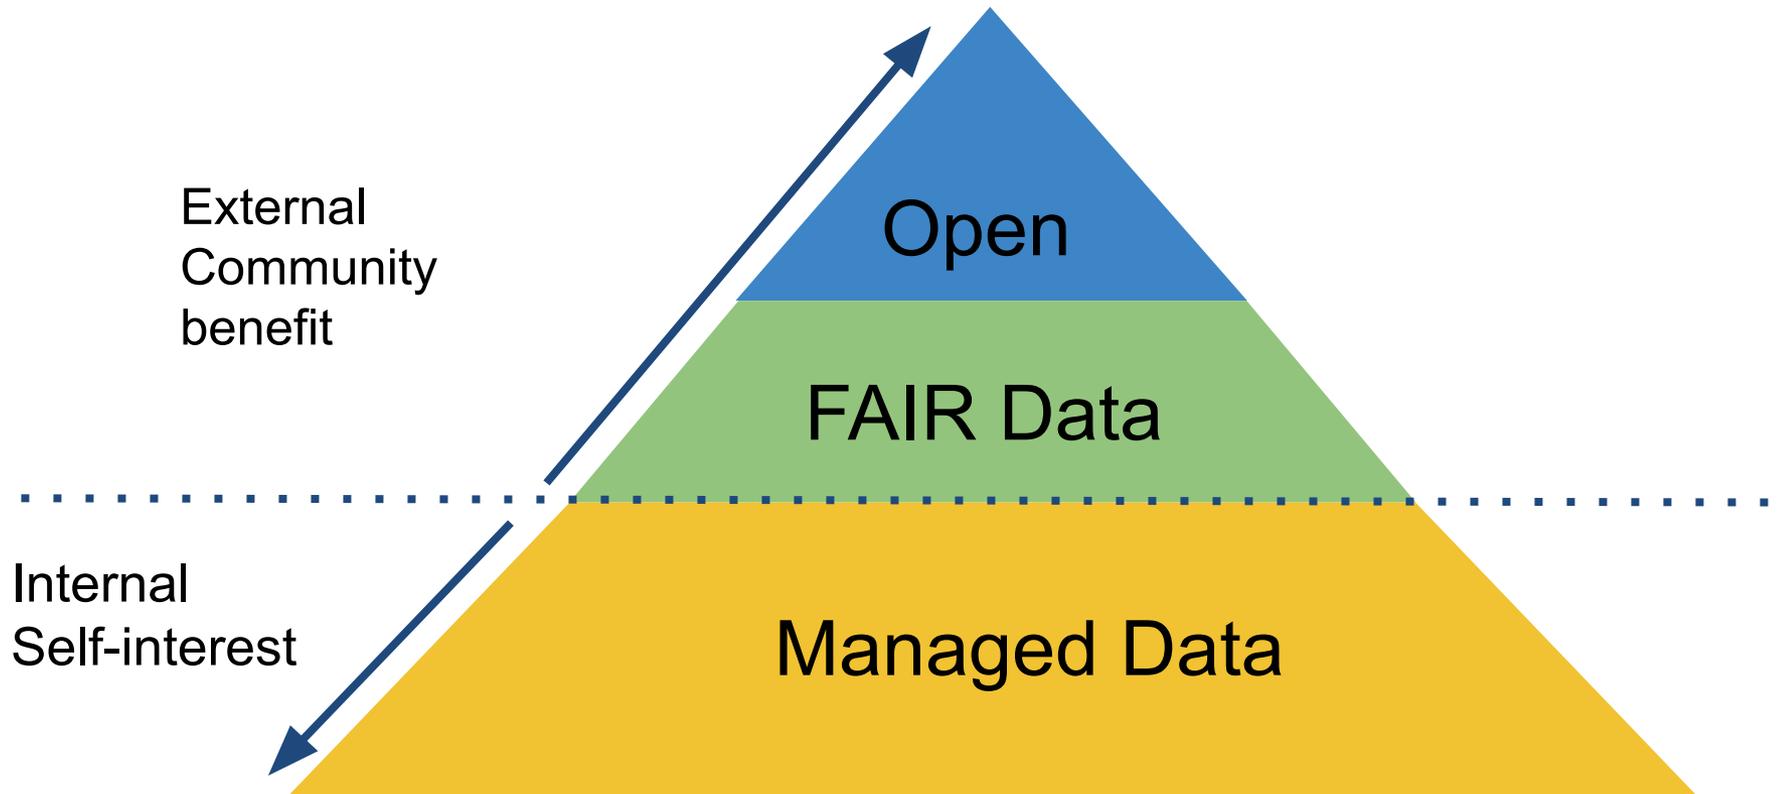

# Show total individual counts for each county
county_df["y"] = 0
fig1 = px.bar(county_df, x="individualCount", y="y", text = '
                color=county_df["individualCount"].keys(), ori
fig1.update_yaxes(showtickLabels=False, title=None)
fig1.update_xaxes(range=[0, 3500])
fig1.update_layout(margin={"r": 0, "t": 0, "l": 0, "b": 0})
fig1.show()
```

The code execution results in a bar chart titled 'Show sightings counts for each county'. The x-axis represents the number of sightings, ranging from 0 to 3500. The y-axis represents the county. The chart shows a large pink bar for Pingtung (3162 sightings) and a smaller purple bar for Taitung (200 sightings). Other counties have very low counts. A legend on the right lists the counties: Hualien, Kaohsiung, Keelung, Kinmen, New Taipei, Penghu, Pingtung, Tainan, Taitung, and Yilan.

At the bottom of the JupyterLab interface, the status bar shows: Simple, 0, 1, Python 3 (ipykernel) | Idle, Mem: 214.97 / 2048.00 MB, Mode: Command, Ln 1, Col 1, Example.ipynb, 0.

Project Roles

- Member
 - can see the project's private datasets
- Editor
 - Make the dataset public or private.
 - Can add and edit datasets, but not manage project members.
- Admin
 - Can add/edit and delete datasets, as well as manage project members.

Well managed and preserved research data is the cornerstone of reproducible research.

Let's practice the FAIR data principles together. May all research data be findable, accessible, interoperable, and reusable!

謝謝！ Thank You!

The depositar is a collaboration at the Institute of Information Science, the Research Center for Information Technology Innovation, and the Research Center for Humanities and Social Sciences (GIS Center) in Academia Sinica, Taiwan. The project has been supported, in part, by grants from Taiwan's National Science and Technology Council.

The *depositar* project team: T-R Chuang, M-S Ho, C-J Lee & C-H Ally Wang.

「研究資料寄存所」是中央研究院資訊科學研究所、資訊科技創新研究中心、人文社會科學研究中心(地理資訊科學研究專題中心)的協作專案，部份經費來自台灣國科會的專題研究計畫。

研究資料寄存所計畫成員：莊庭瑞、何明諳、李承 彝、王家薰。
